Mount Sinai
Myocarditis
Biobank

We're looking for children and adults of all ages who experienced myocarditis to learn more about the way that human genes contribute to this disease.

Some people are more genetically at-risk for myocarditis than others. This research seeks to understand the genes that put people at risk, and learn how to identify patients who are at risk before they develop myocarditis.

Participants will be asked to:

- Provide a saliva or blood sample
- Give permission for their doctors to share medical records related to their myocarditis diagnosis

Participants will receive:

- \$25 after sample and records are received

Location

- Either at your home or your doctors' office

Are you eligible?

- Any age
- Documented diagnosis of myocarditis

If you are unsure if you meet the requirements, call, text or e-mail a member of the study team:

- Abrisham Eskandari
